

Build better veins: Advanced vein modelling in Leapfrog Geo

QUICK REFERENCE GUIDE

In this session of the Leapfrog Geo Mastery Series, we learnt the specialised workflows to model complex, zoned veins and produce more reliable resource estimations.

Below is our quick reference guide for the session, with links to further learning on each of the areas covered:

Course: Introduction to vein modelling with Leapfrog Geo.

Quick link: [An 80-minute module on building a three-dyke geological model and constructing a vein system](#)

Veins: Create and refine vein surfaces using different data sources and an iterative modelling process.

Quick link: [How to create vein surfaces](#)

Vein Systems: Create, manage, and refine vein systems, including how veins interact and generate outputs within a geological model.

Quick link: [How to add veins to the vein system](#)

Offset Surfaces: Create and improve offset surfaces from a reference mesh, including key settings, limitations, and modelling considerations.

Quick link: [How to use the offset surfaces tool](#)

Vein Reference Surface: Create and customise a vein's reference surface in Leapfrog Geo to control its shape, orientation, and geological accuracy.

Quick link: [How to edit the reference surface](#)
