

# ENERGY STAR Certified Homes County-Level Design Temperature Reference Guide

## Introduction

One requirement of the ENERGY STAR Certified Homes program is to use outdoor design temperatures that do not exceed the maximum cooling season temperature and minimum heating season temperature listed in this reference guide for the state and county in which the home is to be certified. Only two exceptions apply:

1. **Jurisdiction-Specified Temperatures:** If the outdoor design temperatures to be used in load calculations are specified by the jurisdiction where the home will be certified, then these specified temperatures shall be used.
2. **Temperature Exception Request:** In rare cases, the designer may believe that an exception to the limits in the reference guide are warranted for a particular state and county. If so, the designer must complete and submit a Design Temperature Exception Request, including a justification for the exception, to [energystarhomes@energystar.gov](mailto:energystarhomes@energystar.gov) for review and approval prior to the home's certification.

To obtain the most accurate load calculations, EPA recommends that designers always use the ACCA Manual J, 8th edition, 1% cooling season design temperature and 99% heating season design temperature for the weather location that is geographically closest to the home to be certified.

## How to Use this Reference Guide

1. Determine the state and county in which the home is to be certified.
2. Locate the state and county in Exhibit 1 of this document.
3. Utilize the corresponding design temperatures in the load calculations, as follows, and document the values in Item 3.3 of the HVAC Design Report:
  - a. Use a cooling season outdoor design temperature less than or equal to the 1% Cooling Temperature.
  - b. Use a heating season outdoor design temperature equal to or greater than the 99% Heating Temperature.
4. If a Condition B Climate will be used to select the cooling sizing limit, then utilize the corresponding HDD/CDD Ratio and document the value in Item 4.14.2 of the HVAC Design Report.

## Example

A home will be certified in Travis County, TX. By consulting the reference guide, we find that the cooling season outdoor design temperature limit is 98 F and the heating season outdoor design temperature limit is 30 F. This means that the designer must:

- Use a cooling season design temperature that is less than or equal to 98 F.
- Use a heating season design temperature that is equal to or greater than 30 F.
- Not use the cooling sizing limit for a Condition B Climate because the HDD/CDD Ratio is 0.2, which is < 2.0.

## Methodology

The temperatures in this reference guide utilize the 1% cooling and 99% heating design temperatures in the *ASHRAE 2013 Handbook of Fundamentals* and *Manual J Design Conditions 8<sup>th</sup> Edition*. Individual counties were assigned the design values in this document using the following logic:

- **One weather station within the county.** If only one weather station was present within the county's boundaries, then the cooling and heating design temperatures for that weather station were assigned to the entire county.
- **Multiple weather stations within the county.** If more than one weather station was present within the county's boundary, then the highest cooling and lowest heating design temperatures among the weather stations in the county were assigned to the entire county.
- **No weather stations within the county.** If no weather stations were present within the county's boundary, then the cooling and heating design temperatures for the closest weather station were assigned to the entire county. To determine the closest weather station, only the weather stations assigned to other counties were considered. The closest station was determined by assessing the distance between the geographic center of the county and the location of the applicable weather stations.
