

Problem with hidden page that is set to public – not accessible

Steps to produce it:

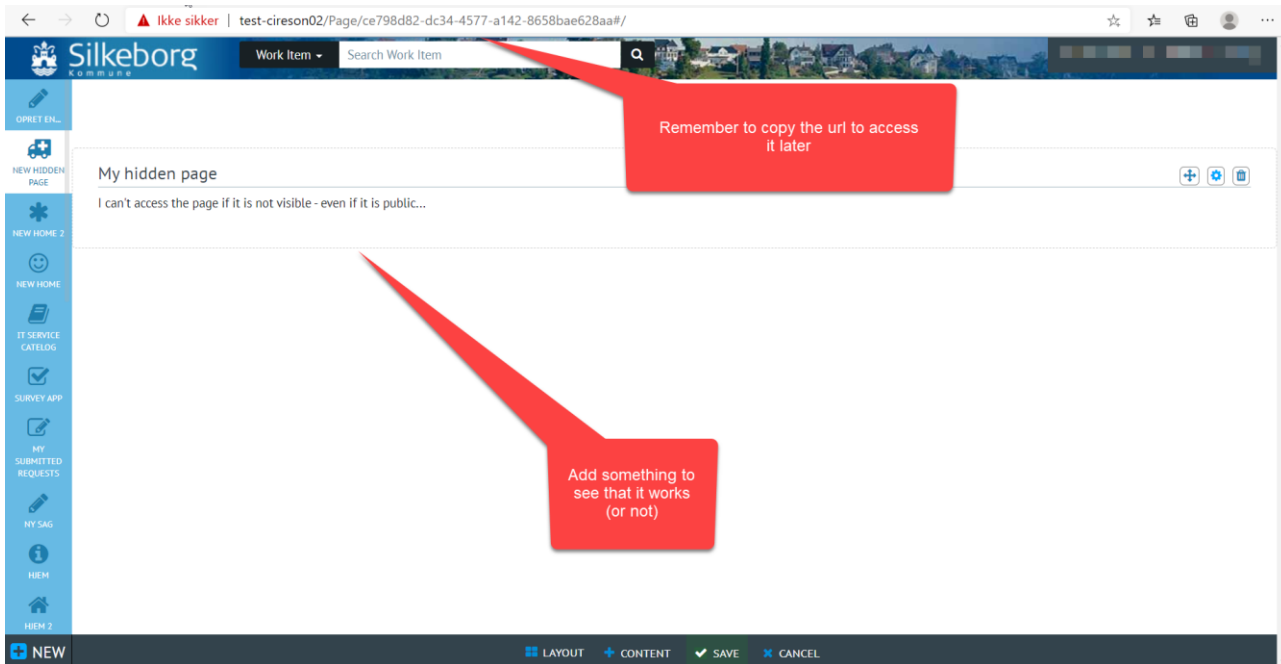

1. Create a new Page in Navigation

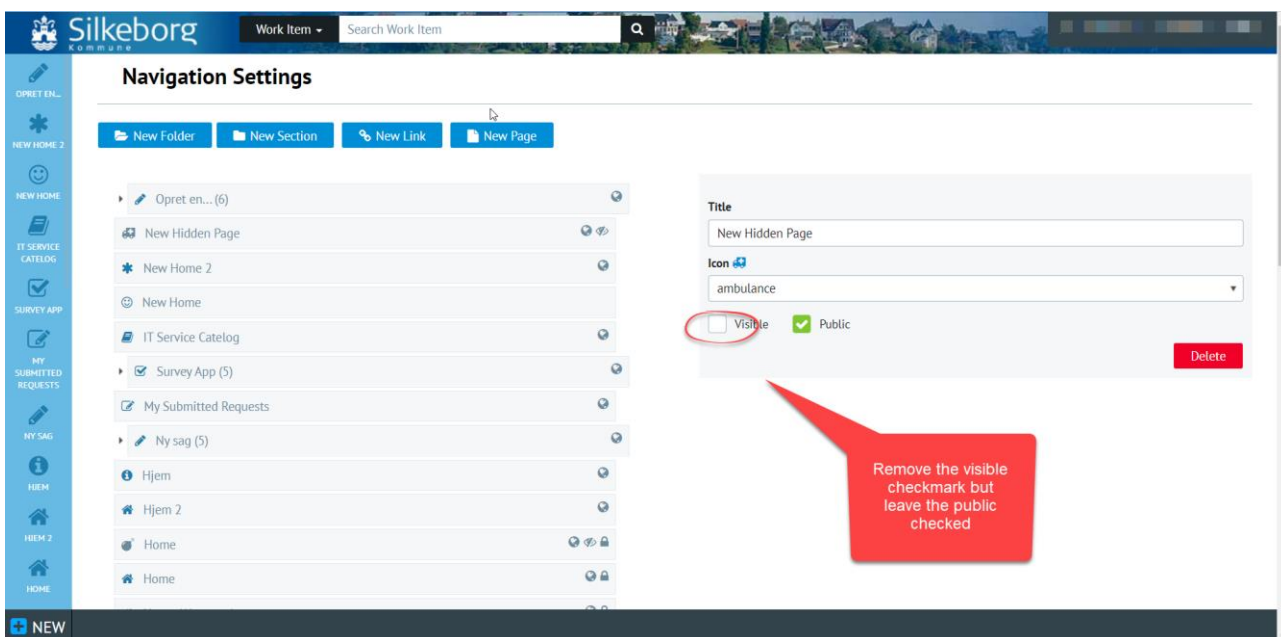

2. Give the new page a Name and make it visible and public

3. Add something to the page and remember to copy the url path to the page so you can access it when it is hidden

4. Remove the checkmark in navigation menu to hide the page from the left side menu

5. Access the url copied before
