

1. We have a pdf file in a batch.

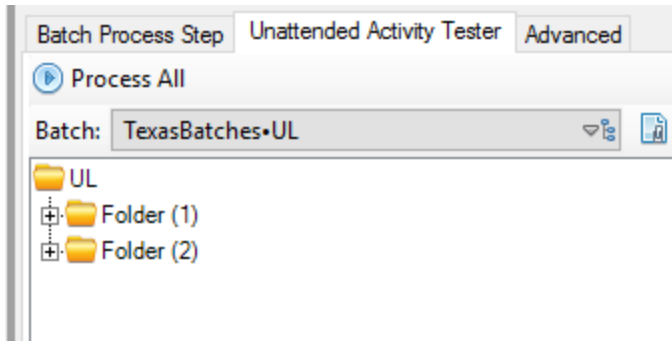

2. Once we apply Split step, batch looks as shown below.

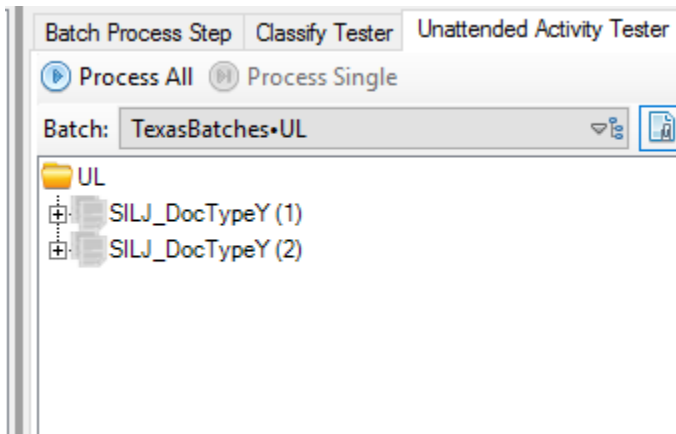

3. Now after using Undo Separator, batch look like this

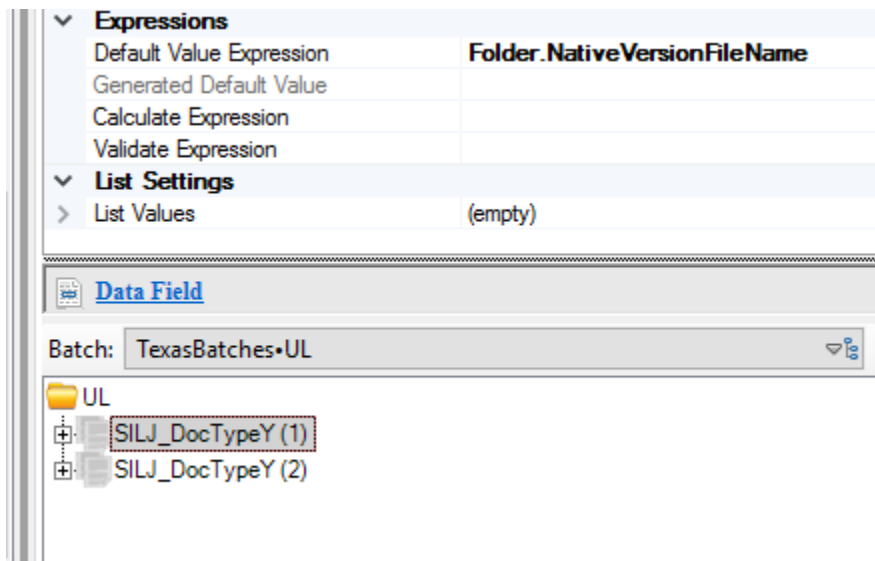

4. After using Event based Separator, each page is converted into folder

5. After Classification step, batch looks like this

6. Now we want to get Original file name for each document,

We are using Default Value Expression “**Folder.NativeVersionFileName**” to get file name

Generally, it works when we do not use “Undo Separation” Step. but here we are using Undo Separate step, since we want to create each page as a document, classify it and apply corresponding template to extract data.

Kindly let us know if there is any alternate way to get file name in these situations.
